
The characterization of oral micro biome in periodontally healthy people

Magdalena Pavlikova

Abstract: The oral microbiome is a complex community of microorganisms that inhabit the oral cavity. In periodontally healthy people, the oral microbiome is characterized by a high degree of diversity and stability. The composition of the oral microbiome is influenced by various factors, including host genetics, diet, and oral hygiene. The oral microbiome plays a crucial role in maintaining oral health and preventing periodontal disease. This study aims to characterize the oral microbiome in periodontally healthy people and to identify the key bacterial species that contribute to oral health.
