Recent advances in surgical endoscopy

Reno Rudiman
Padjadjaran University, Indonesia

Gastrointestinal endoscopy is a medical instrument for examining the interior canal of digestive tract. The use of the tool has been reported as early as 1822 by William Beaumont. Modern endoscopy as what we now daily use, has been invented in 1980. Various digestive diseases that previously must be diagnosed and treated by invasive method can now take the advantage of endoscopy with ease of procedure and excellent diagnostic accuracy, and can even achieve therapeutic results without open surgery.
