Perspective

The emergence and spread of Coronavirus-induced illness has posed a global public health hazard. During the pandemic, the case of patients with non-COVID-related chronic health issues, such as diabetes, has been a major concern. People faced digital and communication barriers during the pandemic-related limitations. As a result, telemedicine, including the Indian government, has been adopted for the use of telemedicine through a wide range of telemedicine in the delivery of health care by health care providers using technology for illness management and health improvement when
