

Experimental setup and method

Macroscopic spray characteristics experimental setup and procedures

The GDI injector used in this disquisition is from a binary-injection Spark Ignition(SI) machine. As the perforation figure and spot sketch presented the injector has five holes with a periphery of 0.174 mm [9]. In this disquisition, spot sprays are numbered as sprays “ 1 ” to “ 5 ”. The utilised energies are marketable gasoline and absolute ethanol, which parcels are listed in Table 1. Regarding the goods of energy parcels in the utilisation of common GDI machines, it would be better to increase the machine’s flash power response to use gasoline, which has a fairly low heat of vaporisation. With the advantages of low carbon content, ethanol is typically recognised as reducing the product of PM emigrations during machine combustion process [10]. The relative disquisition on the macroscopic characteristics of gasoline and ethanol smash spray was carried out via Schlieren fashion, which has the advantage of getting the image of gas-liquid two- phase grounded on the differences of refractive indicator slants. The whole experimental setup of macroscopic characteristics can be seen. After connecting to a essence holder, injector can be acclimated and fixed to a specific distance and angle pertaining to a wall, which is a veritably flat aluminium amalgamation plate with a roughness of lower than 0.4 mm. Energy injection pressure was named to be 10 MPa, 30 MPa and 50 MPa, representing common, high and ultra-high pressures of GDI injector, independently [11]. The drive signal of energy injection was transmitted from a programmable Electronic Control Unit(ECU), which could also synchronise injection with “ 768 × 768 pixels at 10 000 frames per second ” images captured by a high- speed camera. also, using MATLAB, the captured images were converted to grayscale,
