Abstract

The rise in dementia prevalence globally has highlighted the need for innovative solutions to improve care and support caregivers. This review explores the latest technological advancements, including artificial intelligence, telemedicine, and digital health tools, and their potential to enhance patient outcomes and caregiver well-being. Key challenges and future research directions are also discussed.

mitochondrial damage
 modulates microglial activation phenotype
 Endothelial function and vascular response to mental stress are impaired in patients with apical ballooning syndrome
 Neurohumoral features of myocardial stunning due to sudden emotional stress

Neuroleptic sensitivity in dementia with
 Thoracolumbar Spine Surgery
