the indicator of drug dependence is the inability to live without drugs. The self-control category can be divided into two categories. The frst stage, severe withdrawal, appears immediately after discontinuation of the drug, which is characterized by the appearance of withdrawal symptoms. Withdrawal symptoms are specifc to each class of drugs, and symptoms disappear as a result of re-administration of the drug itself or ?

O when using amphetamines mean that their use is not limited

use, fnding activities you enjoy instead of amphetamine use, gaining support through others. One of the major problems in clinical practice with drug dependence is the high rate of relapse, even after prolonged fasting. Recurrence is thought to be partly due to the intensity of drug cravings and repeated drug use. Amphetamine is very addictive. Be

tion to control withdrawal symptoms increases the chances of a drugdependent patient completing the detoxif cation. Although an important part of the broader drug-dependent approach, detoxifcation does not act as an independent treatment in bringing about long-term behavioral changes and reducing drug use.
