

Editor Note on Advanced Chronic Kidney Disease (CKD) or End-stage Renal Disease

John christian*

St Stephen's College, India

Description

It is known as chronic kidney disease in which the glomerular filtration rate (GFR) is less than 30 ml/min. End-stage kidney disease patients may have a wide range of comorbidities. Palliative care is the need of the hour when it comes to a patient's quality of life. Palliative care can help with symptom control and advance care preparation, among other items. People with CKD and ESRD diseases should be incorporated with palliative care because these patients' life expectancy is drastically lowered and experience a variety of symptoms, including pain, nausea, itching, and sleep problems, which must be addressed. The cost of dialysis is significant for the patient and his or her family, as well as the government. Palliative care should be begun as soon as possible.
