

acid fast bacilli (AFB). PCR for *Mycoplasma pneumoniae* and *Chlamydia* one were negative, blood culture isolator; Viral IF, *Legionella* antigen were also negative (urine). Eye exam was normal.

**Figure 1:** Initial chest X-ray showed small foci of alveolar consolidation distributed in both lungs predominant in middle lobe, no pleural effusion and no cavitation.

**Figure 2** CT scan showed diffuse bilateral nodular lesions in lung parenchyma, associated with multiple mediastinal lymphadenomegaly, right lower lobe atelectasis, slight right and left pleural effusion.

Our final diagnosis was immune reconstitution inflammatory syndrome (IRIS) in a negative HIV-patient. It took many weeks before
