Abstract

Biotechnological tactics are promising selections to petrochemical routes for overcoming the challenges of useful resource depletion in the future in a sustainable way. The techniques of white biotechnology enable the utilization of cheaper and renewable assets for the manufacturing of an extensive vary of bio-based compounds. Renewable resources, such as agricultural residues or residues from meals production, are produced in giant quantities have been proven to be promising carbon and/or nitrogen sources. This chapter focuses on the biotechnological manufacturing of lactic acid, acrylic acid, such site hole; coertareid; candidaetabloraicd; cardideetabloraicd; formology; ewable residues, this b30.9(9es, this b30.9(9odues, eges, Hellas, Institute for Research and Technology of Thessaly, Technology Park of Thessaly, Greece, E-mail: austin.nichols55@gmail.com
