Conclusion

Conclusion

The study highlights the significant impact of palliative care on the quality of life of outpatients with colon cancer. It emphasizes the need for a multidisciplinary approach involving medical, nursing, and social services to address the physical, emotional, and spiritual needs of patients. The findings suggest that early integration of palliative care can lead to better symptom management, improved patient satisfaction, and enhanced overall quality of life. Further research is needed to explore the long-term effects of palliative care interventions and to develop standardized protocols for their implementation in clinical practice.
