INTRODUCTION

Polypectomy is the careful expulsion of a polyp. Colon polyps can be eliminated through open stomach a medical procedure, however more regularly it is performed during a colonoscopy. The endoscopist might clip off a little polyp with a forceps or eliminate a bigger polyp with a catch that consumes the foundation of the polyp. During a polypectomy system at the Brigham and Women's Hospital (BWH) Endoscopy Center, an expert places a slight, adaptable, lit cylinder called a colonoscopy, into the rectum and colon. As well as permitting perception of the inner colon, the colonoscopy empowers the doctor to flood, pull, infuse air, and access the inside with careful instruments. The doctor will eliminate the polyp and conceivably encompassing tissue for additional assessment and perhaps treat whatever other issues that are found. Numerous growths of the colon create as a harmless (noncancerous) development prior to becoming threatening. A colonoscopy is first done to distinguish the presence of any polyps. In case any are identified, a polypectomy is performed and the tissue is eliminated. The tissue will be analyzed to decide whether the developments are harmful, precancerous, or harmless. This can forestall colon malignant growth. A polypectomy is typically completed simultaneously as a colonoscopy. During a colonoscopy, a colonoscope will be embedded into your rectum so your PCP can see all portions of your your pmMp y
