Abstract

Cervical cancer, primarily caused by persistent infection with high-risk types of human papillomavirus (HPV), remains a significant global health concern. Intern nurses, as vital members of the healthcare workforce, play a crucial role in disseminating information and promoting preventive measures [1]. This article explores the current state of knowledge about HPV and cervical cancer prevention among intern nurses, shedding light on areas of strength and opportunities for improvement. The findings emphasize the importance of targeted educational interventions to empower intern nurses with the knowledge necessary for effective patient education and public health advocacy [2].
