

A Note on Hospice and palliative medicine

Karen Jones*

All India Institute of Medical Sciences, India

Description

Hospice and palliative medicine is a structured medical subspecialty dealing with symptom control, pain relief, and end-of-life treatment.

What is palliative care

If the condition is severe but not life-threatening, this programme helps to alleviate pain and assist with other issues. It assists people in coping with the symptoms of long-term illnesses such as cancer, kidney disease, or AIDS, as well as the treatment's side effects.

Palliative medicine isn't meant to take the place of other therapies. It's a supplement that will help you and your family deal with nausea, nerve pain, and shortness of breath, among other items.

Pain Medications for Palliative Care

There are two forms of drugs for pain management: opioids, which dull pain in the body, and adjuvant analgesics, or helper medications, which may target particular types of pain, often by supporting the body's natural pain relief mechanisms.
