

# Restoration of Ecology through Bioremediation

Hallie Justus\*

School of the Environment, Florida A&M University, Tallahassee, Florida, USA

## Commentary

Bioremediation is a process that uses living organisms to clean up contaminated environments. It is a natural process that can be enhanced or controlled to remove pollutants from soil, water, and air. The organisms used in bioremediation are typically bacteria, fungi, and plants. They break down pollutants into simpler, less toxic substances that can be safely disposed of or recycled. Bioremediation is a cost-effective and environmentally friendly method of cleaning up contaminated sites. It is often used in conjunction with other remediation techniques, such as soil excavation and groundwater pumping. The use of bioremediation can help restore ecosystems and protect human health and the environment.
