

Infections with Intestinal Parasites: Epidemiology

Department of Agriculture, Livestock Insects Research Laboratory, USA

Numerous millions of individuals are infected with intestinal protozoa and helminths, especially youngsters in lowand middle-income nations. The primary method for managing helminthiases is preventative chemotherapy. However, in environments with poor access to clean water, sanitation, and hygiene, re-infection happens quickly. We carried out a cross-sectional epidemiological study in 56 communities across three departments in south-central Côte d'Ivoire in the months of August and September 2014. Urine and stool samples were requested from study participants. Using the Kato-Katz technique and a formalin-ether concentration approach, stool samples were checked for helminth and
