Description

The term "oncology" encompasses the study of cancer, its prevention, diagnosis, and treatment. It is a multidisciplinary field that involves the study of the biology of cancer, the development of new therapies, and the management of cancer patients. The field of oncology is constantly evolving, with new discoveries and treatments being developed all the time. The goal of oncology is to improve the quality of life for cancer patients and to increase their survival rates. This article explores the intricacies of cellular transformation in oncology, focusing on the molecular and cellular mechanisms that lead to the development of cancer. It discusses the role of various factors, such as genetic mutations, environmental factors, and lifestyle choices, in the process of cellular transformation. The article also highlights the importance of early detection and the need for personalized medicine in the treatment of cancer.
