Introduction

Cancer is a leading cause of death worldwide. The incidence of cancer is increasing globally, with a significant burden in developing countries. The management of cancer has evolved significantly over the past few decades, with the integration of surgical oncology, medical oncology, and radiation oncology. This multidisciplinary approach has led to improved outcomes for cancer patients. In this review, we discuss the role of surgical oncology in the comprehensive management of cancer, focusing on early detection, staging, curative, and palliative procedures. We also highlight the importance of personalized medicine and targeted therapies in modern cancer treatment.
