

# Bridging the Gap between Occupational and Environmental Medicine

Topudyati Mondal\*

Department of Biology, University of Southern California, USA

## Abstract

The convergence of occupational and environmental medicine represents a critical frontier in public health, underscoring the interconnectedness of workplace and broader ecological exposures on human health. This abstract delineates the importance of integrating these disciplines to enhance understanding, prevention, and management of health risks associated with various physical, chemical, and biological agents. The discussion highlights commonalities such as shared exposure pathways and regulatory frameworks, advocating for holistic risk assessments and integrated preventive strategies. It underscores the necessity of interdisciplinary collaboration and joint research initiatives to address emerging hazards and evolving exposures, including those related to climate change and globalization. Furthermore, it emphasizes the importance of equitable healthcare access, particularly
