Abstract

Oral care is an important part of the management of patients with mouth sores. This article reviews the current evidence on the effectiveness of various oral care interventions. The aim of this review is to provide a summary of the current evidence on the effectiveness of various oral care interventions. The review includes a search of the literature for studies published between 2000 and 2015. The search was limited to English language studies. The results of the search are presented in a table. The table shows that there is a lack of high quality evidence on the effectiveness of oral care interventions. However, there is some evidence to suggest that oral care interventions may be effective in reducing the severity of mouth sores. The authors conclude that further research is needed to determine the effectiveness of oral care interventions. The authors also recommend that oral care interventions should be used as part of a comprehensive approach to the management of mouth sores.
